

POWER SUPPLY

- 200-240V Input
- Width only 125mm
- Efficiency up to 95%
- Excellent Partial Load Efficiency
- 150% (1440W) Peak Load Capability
- Easy Fuse Tripping due to High Overload Current
- Active Power Factor Correction (PFC)
- Minimal Inrush Current Surge
- Current Sharing Feature for Parallel Use
- Full Power Between -25°C and +60°C
- DC-OK Relay Contact
- Shut-down Input
- 3 Year Warranty

GENERAL DESCRIPTION

The most outstanding features of the DIMENSION Q-Series DIN-rail power supplies are the extremely high efficiencies and the small sizes, which are achieved by a synchronous rectification and other technological designs.

The QS40.484 is a device for 200-240V mains voltages. Large power reserves of 150% support the starting of heavy loads such as DC-motors or capacitive loads. In many cases this allows the use of a unit from a lower wattage class which saves space and money.

High immunity to transients and power surges as well as low electromagnetic emission makes usage in nearly every environment possible.

The integrated output power manager and input fuses as well as the near zero input inrush current make installation and usage simple. Diagnostics are easy due to the DC-OK relay, a green DC-OK LED and the red overload LED.

A large international approval package for a variety of applications makes this unit suitable for nearly every application.

SHORT-FORM DATA

Output voltage	DC 48V	
Adjustment range	48 - 56V	
Output current	20 – 17.8A	continuous
	30 – 26.7A	for typ. 4s
Output power	960W	continuous
	1440W	for typ. 4s
Output ripple	< 150mVpp	20Hz to 20MHz
Input voltage	200-240V	-15%/+10%
Mains frequency	50-60Hz	±6%
AC Input current	4.6A	at 230Vac
Power factor	0.96	at 230Vac
AC Inrush current	typ. 14A peak	
Efficiency	95.0%	at 230Vac
Losses	50.5W	at 230Vac
Temperature range	-25°C to +70°C	operational
Derating	24W/°C	+60 to +70°C
Hold-up time	typ. 30ms	at 230Vac
Dimensions	125x124x127mm WxHxD

TERMINOLOGY AND ABBREVIATIONS

PE and \oplus symbol	PE is the abbreviation for Protective Earth and has the same meaning as the symbol \oplus .
Earth, Ground	This document uses the term "earth" which is the same as the U.S. term "ground".
T.b.d.	To be defined, value or description will follow later.
AC 230V	A figure displayed with the AC or DC before the value represents a nominal voltage with standard tolerances (usually $\pm 15\%$) included. E.g.: DC 12V describes a 12V battery disregarding whether it is full (13.7V) or flat (10V)
230Vac	A figure with the unit (Vac) at the end is a momentary figure without any additional tolerances included.
50Hz vs. 60Hz	As long as not otherwise stated, AC 230V parameters are valid at 50Hz mains frequency.
may	A key word indicating flexibility of choice with no implied preference.
shall	A key word indicating a mandatory requirement.
should	A key word indicating flexibility of choice with a strongly preferred implementation.

1. INTENDED USE

This device is designed for installation in an enclosure and is intended for the general use such as in industrial control, office, communication, and instrumentation equipment.

Do not use this power supply in aircraft, trains, nuclear equipment or similar systems where malfunction may cause severe personal injury or threaten human life.

This device is designed for use in non-hazardous, ordinary or unclassified locations.

2. INSTALLATION REQUIREMENTS

This device may only be installed and put into operation by qualified personnel.

This device does not contain serviceable parts. The tripping of an internal fuse is caused by an internal defect.

If damage or malfunction should occur during installation or operation, immediately turn power off and send unit to the factory for inspection.

Mount the unit on a DIN-rail so that the output and input terminals are located on the bottom of the unit. For other mounting orientations see de-rating requirements in this document. See chapter 25.14.

This device is designed for convection cooling and does not require an external fan. Do not obstruct airflow and do not cover ventilation grid (e.g. cable conduits) by more than 30%!

Keep the following installation clearances: 40mm on top, 20mm on the bottom, 5mm on the left and right sides are recommended when the device is loaded permanently with more than 50% of the rated power. Increase this clearance to 15mm in case the adjacent device is a heat source (e.g. another power supply).

⚠ WARNING Risk of electrical shock, fire, personal injury or death.

- Do not use the power supply without proper grounding (Protective Earth). Use the terminal on the input block for earth connection and not one of the screws on the housing.
- Turn power off before working on the device. Protect against inadvertent re-powering.
- Make sure that the wiring is correct by following all local and national codes.
- Do not modify or repair the unit.
- Do not open the unit as high voltages are present inside.
- Use caution to prevent any foreign objects from entering the housing.
- Do not use in wet locations or in areas where moisture or condensation can be expected.
- Do not touch during power-on, and immediately after power-off. Hot surfaces may cause burns.

3. AC-INPUT

AC input	nom.	AC 200-240V	suitable for TN-, TT- and IT mains networks
AC input range	min.	170-264Vac	continuous operation
		264-300Vac	< 500ms
Allowed voltage L or N to earth	max.	300Vac	
Input frequency	nom.	50–60Hz	±6%
Turn-on voltage	typ.	164Vac	steady-state value, see Fig. 3-1
Shut-down voltage	typ.	151Vac	steady-state value, see Fig. 3-1

Input: 230Vac

Input current	typ.	4.6A	at 48V, 20A, see Fig. 3-3
Power factor *)	typ.	0.96	at 48V, 20A, see Fig. 3-4
Start-up delay	typ.	750ms	see Fig. 3-2
Rise time	typ.	20ms	0mF, 48V, 20A, see Fig. 3-2
	typ.	40ms	20mF, 48V, 20A, see Fig. 3-2
Turn-on overshoot	max.	200mV	see Fig. 3-2

*) The power factor is the ratio of the true (or real) power to the apparent power in an AC circuit.

Fig. 3-1 **Input voltage range**

Fig. 3-2 **Turn-on behavior, definitions**

Fig. 3-3 **Input current vs. output load at 48V**

Fig. 3-4 **Power factor vs. output load**

4. DC-INPUT

Do not operate the power supply with DC-input voltage

5. INPUT INRUSH CURRENT

An active inrush limitation circuit limits the input inrush current after turn-on of the input voltage and after short input voltage interruptions.

The charging current into EMI suppression capacitors is disregarded in the first microseconds after switch-on.

Input: 230Vac

Inrush current	max.	18A _{peak}	over entire ambient temperature range
	typ.	14A _{peak}	over entire ambient temperature range
Inrush energy	max.	4A ² s	over entire ambient temperature range
Inrush delay (A)	typ.	750ms	

Fig. 5-1 Input inrush current, typical behavior

A Inrush delay
 Input: 230Vac
 Output: 48V, 20A
 Ambient: 25°C
 Upper curve: Input current 5A / DIV
 Middle curve: Input voltage 200V / DIV
 Lower curve: Output voltage 10V / DIV
 Time basis: 50ms / DIV

6. OUTPUT

Output voltage	nom.	48V	
Adjustment range	min.	48-54V	guaranteed
	max.	56V ****)	at clockwise end position of potentiometer
Factory setting	typ.	48.0V	±0.2%, at full load, cold unit, in "single use" mode
	typ.	46.0V	±0.2%, at full load, cold unit, in "parallel use" mode
	typ.	48.0V	at no load, cold unit, in "parallel use" mode
Line regulation	max.	10mV	170-264Vac
Load regulation	max.	50mV	in "single use" mode: static value, 0A → 20A, see Fig. 6-1
	typ.	2000mV	in "parallel use" mode: static value, 0A → 20A, see Fig. 6-2
Ripple and noise voltage	max.	150mVpp	20Hz to 20MHz, 50Ohm
Output current	nom.	20A	continuously available at 48V, see Fig. 6-1 and Fig. 6-2
	nom.	17.8A	continuously available at 54V, see Fig. 6-1 and Fig. 6-2
	nom.	30A / 26.7A *)	short term available BonusPower®*), at 48V / 54V, for typical 4s, see Fig. 6-1 and Fig. 6-2
Output power	nom.	960W	continuously available at 48-54V
	nom.	1440W *)	short term available BonusPower®*) at 48-54V
BonusPower® time	typ.	4s	duration until the output voltage dips, see Fig. 6-4
	min.	3.5s	
	max.	4.5s	
BonusPower® recovery time	typ.	7s	overload free time to reset power manager, see Fig. 6-5
Overload behaviour		cont. current	output voltage > 40Vdc, see Fig. 6-1
		hiccup-mode **)	output voltage < 40Vdc, see Fig. 6-1
Short-circuit current	min.	30A ***)	load impedance 50mOhm, see Fig. 6-3
	max.	34A ***)	load impedance 50mOhm, see Fig. 6-3
Output capacitance	typ.	3 660µF	included in the power supply

*) **BonusPower®, short term power capability (up to typ. 4s)**

The power supply is designed to support loads with a higher short-term power requirement without damage or shutdown. The short-term duration is hardware controlled by an output power manager. This BonusPower® is repeatedly available. Detailed information can be found in chapter 25.1. If the power supply is loaded longer with the BonusPower® than shown in the Bonus-time diagram (see Fig. 6-4), the max. output power is automatically reduced to 960W. If the power requirement is continuously above 960W and the voltage falls below approx. 40V (due to the current regulating mode at overload), the unit shuts-off and makes periodical restart attempts. This behavior is called hiccup mode which is described below. If the voltage is above 20V, the unit continuously delivers current.

***) **Hiccup Mode**

Up to 4s of overloading, the power supply delivers continuous output current. After this, the output power is reduced to nearly zero for approx. 17s before a new start attempt is automatically performed. If the overload has been cleared, the device will operate normally. If the overload still exists, the output current will be delivered for 2 to 4s (depending on the overload) again followed by a 17s rest time. This cycle is repeated as long as the overload exists. See Fig. 6-3. During the off-period a small rest voltage and rest current is present on the output.

****) Discharge current of output capacitors is not included.

*****) This is the maximum output voltage which can occur at the clockwise end position of the potentiometer due to tolerances. It is not guaranteed value which can be achieved. The typical value is about 55V.

Peak current capability (up to several milliseconds)

The power supply can deliver a peak current which is higher than the specified short term current. This helps to start current demanding loads or to safely operate subsequent circuit breakers.

The extra current is supplied by the output capacitors inside the power supply. During this event, the capacitors will be discharged and causes a voltage dip on the output. Detailed curves can be found in chapter 25.2.

Peak current voltage dips	typ.	from 48V to 41V	at 40A for 50ms, resistive load
	typ.	from 48V to 35V	at 100A for 2ms, resistive load
	typ.	from 48V to 33V	at 100A for 5ms, resistive load

Fig. 6-1 Output voltage vs. output current in "single use" mode, typ.

Fig. 6-2 Output voltage vs. output current in "parallel use" mode, typ.

Fig. 6-3 Hiccup mode behavior at short circuit or overload, typ.

Fig. 6-4 Bonus time vs. output power

Fig. 6-5 BonusPower® recovery time

The BonusPower® is available as soon as power comes on and immediately after the end of an output short circuit or output overload.

Fig. 6-6 **BonusPower® after input turn-on**

7. HOLD-UP TIME

Input: 230Vac

Hold-up Time	typ.	30ms	at 48V, 20A, see Fig. 7-1
	typ.	58ms	at 48V, 10A, see Fig. 7-1

Fig. 7-1 **Hold-up time vs. input voltage**

Fig. 7-2 **Shut-down behavior, definitions**

8. DC-OK RELAY CONTACT

This feature monitors the output voltage, which is produced by the power supply itself. It is independent of a back-fed voltage from a unit connected in parallel to the power supply output.

Contact closes	As soon as the output voltage reaches 90% of the adjusted output voltage.		
Contact opens	As soon as the output voltage dips more than 10% below the adjusted output voltage. Short dips will be extended to a signal length of 250ms. Dips shorter than 1ms will be ignored.		
Contact re-closes	As soon as the output voltage exceeds 90% of the adjusted voltage.		
Contact ratings	max	60Vdc 0.3A, 30Vdc 1A, 30Vac 0.5A	resistive load
	min	1mA at 5Vdc	min. permissible load
Isolation voltage	See dielectric strength table in section 19.		

Fig. 8-1 DC-ok relay contact behavior

9. SHUT-DOWN INPUT

This feature allows a switch-off of the output of the power supply with a signal switch or an external voltage. The shut-down function ramps down and has no safety feature included. The shut-down occurs immediately while the turn-on is delayed up to 350ms. In a shut-down condition, the output voltage is <2V and the output power is <0.5W.

The voltage between different -pole output terminals must be below 1V when units are connected in parallel. In a series operation of multiple power supplies only wiring option "A" with individual signal switches is allowed.

Please note that option C requires a current sink capability of the voltage source. Do not use a blocking diode.

Fig. 9-1 Activation of the shut-down input

10. EFFICIENCY AND POWER LOSSES

Input: 230Vac

Efficiency	typ.	95.0%	at 48V, 20A
Average efficiency *)	typ.	94.2%	25% at 5A, 25% at 10A, 25% at 15A. 25% at 20A
Power losses	typ.	3.2W	with activated shut-down
	typ.	12W	at 48V, 0A
	typ.	50.5W	at 48V, 20A

*) The average efficiency is an assumption for a typical application where the power supply is loaded with 25% of the nominal load for 25% of the time, 50% of the nominal load for another 25% of the time, 75% of the nominal load for another 25% of the time and with 100% of the nominal load for the rest of the time.

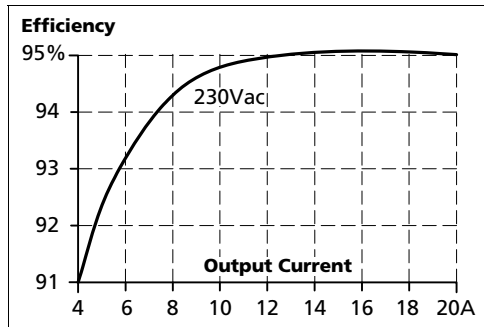

Fig. 10-2 **Losses vs. output current at 48V, typ.**

Fig. 10-3 **Efficiency vs. input voltage at 48V, 20A, typ.**

Fig. 10-4 **Losses vs. input voltage at 48V, 20A, typ.**

11. RELIABILITY

	Input: 230Vac	
Lifetime expectancy *)	65 000h	at 48V, 20A and 40°C
	122 000h	at 48V, 10A and 40°C
	184 000h *)	at 48V, 20A and 25°C
MTBF **) SN 29500, IEC 61709	392 000h	at 48V, 20A and 40°C
	693 000h	at 48V, 20A and 25°C
MTBF **) MIL HDBK 217F	158 000h	at 48V, 20A and 40°C; Ground Benign GB40
	214 000h	at 48V, 20A and 25°C; Ground Benign GB25

*) The **Lifetime expectancy** shown in the table indicates the minimum operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors. Lifetime expectancy is specified in operational hours and is calculated according to the capacitor's manufacturer specification. The manufacturer of the electrolytic capacitors only guarantees a maximum life of up to 15 years (131 400h). Any number exceeding this value is a calculated theoretical lifetime which can be used to compare devices.

) **MTBF stands for **Mean Time Between Failure**, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of a unit to fail and does not necessarily represent the life of a product. The MTBF figure is a statistical representation of the likelihood of a device to fail. A MTBF figure of e.g. 1 000 000h means that statistically one unit will fail every 100 hours if 10 000 units are installed in the field. However, it can not be determined if the failed unit has been running for 50 000h or only for 100h.

12. FUNCTIONAL DIAGRAM

13. TERMINALS AND WIRING

	Input	Output	DC-OK, Shut-down
Type	screw termination	screw termination	spring-clamp termination
Solid wire	0.5-6mm ²	0.5-16mm ²	0.15-1.5mm ²
Stranded wire	0.5-4mm ²	0.5-10mm ²	0.15-1.5mm ²
American Wire Gauge	20-10 AWG	22-8 AWG	26-14 AWG
Wire stripping length	7mm / 0.28inch	12mm / 0.5inch	7mm / 0.28inch
Screwdriver	3.5mm slotted or Pozidrive No 2	3.5mm slotted or Pozidrive No 2	3.5mm slotted
Recommended tightening torque	0.8Nm, 7lb.in	1.2Nm, 10.6lb.in	Not applicable

Instructions:

- Use appropriate copper cables that are designed for minimum operating temperatures of:
 - 60°C for ambient up to 45°C and
 - 75°C for ambient up to 60°C minimum
 - 90°C for ambient up to 70°C minimum.
- Follow national installation codes and installation regulations!
- Ensure that all strands of a stranded wire enter the terminal connection!
- Up to two stranded wires with the same cross section are permitted in one connection point (except PE wire).
- Do not use the unit without PE connection.
- Screws of unused terminal compartments should be securely tightened.
- Ferrules are allowed.

14. FRONT SIDE AND USER ELEMENTS

Fig. 14-1 Front side

A Input Terminals (Screw terminals)

N, L Line input

⊕ ...PE (Protective Earth) input

B Output Terminals (Screw terminals, two pins per pole)

+ Positive output

- Negative (return) output

C "Parallel Use" "Single Use" selector

Set jumper to "Parallel Use" when power supplies are connected in parallel to increase the output power. In order to achieve a sharing of the load current between the individual power supplies, the "parallel use" regulates the output voltage in such a manner that the voltage at no load is approx. 5% higher than at nominal load. See also chapter 25.7. A missing jumper is equal to a "Single Use" mode.

D Output voltage potentiometer

Multi turn potentiometer;

Open the flap to set the output voltage. Factory set: 48.0V

E DC-OK LED (green)

On, when the voltage on the output terminals is >90% of the adjusted output voltage

F Overload LED (red)

- On, when the voltage on the output terminals is <90% of the adjusted output voltage, or in case of a short circuit in the output.

- Flashing, when the shut-down has been activated or the unit has switched off due to over-temperature.

- Input voltage is required

G DC-OK Relay Contact

The DC-OK relay contact is synchronized with the DC-OK LED. See chapter 8 for details.

H Shut-down Input

Allows the power supply to be shut down. Can be activated with a switch contact or an external voltage. See chapter 9 for details.

Indicators, LEDs

	Overload LED	DC-OK LED	DC-OK Contact
Normal mode	OFF	ON	Closed
During BonusPower®	OFF	ON	Closed
Overload (Hiccup mode)	flashing	OFF	Open
Output short circuit	flashing	OFF	Open
Temperature Shut-down	flashing	OFF	Open
Active Shut-down input	flashing	OFF	Open
No input power	OFF	OFF	Open

15. EMC

The power supply is suitable for applications in industrial environment as well as in residential, commercial and light industry environment without any restrictions. The CE mark indicates conformance with EMC directive 2004/108/EC and the low-voltage directive (LVD) 2006/95/EC. A detailed EMC report is available on request.

EMC Immunity		According generic standards: EN 61000-6-1 and EN 61000-6-2		
Electrostatic discharge	EN 61000-4-2	Contact discharge	8kV	Criterion A
		Air discharge	15kV	Criterion A
Electromagnetic RF field	EN 61000-4-3	80MHz-2.7GHz	10V/m	Criterion A
Fast transients (Burst)	EN 61000-4-4	Input lines	4kV	Criterion A
		Output lines	2kV	Criterion A
Surge voltage on input	EN 61000-4-5	L → N	2kV	Criterion A
		L → PE, N → PE	4kV	Criterion A
Surge voltage on output	EN 61000-4-5	+ → -	500V	Criterion A
		+ / - → PE	1kV	Criterion A
Conducted disturbance	EN 61000-4-6	0.15-80MHz	10V	Criterion A
Mains voltage dips	EN 61000-4-11	0% of 200Vac (=0V)	20ms	Criterion A
		40% of 200Vac (=80V)	200ms	Criterion C
		70% of 200Vac (=170V)	500ms	Criterion A
Voltage interruptions	EN 61000-4-11	0% of 200Vac (=0V)	500ms	Criterion C
Voltage sags	SEMI F47 0706	Dips on the input voltage according SEMI F47 standard		
		80% of 200Vac	1000ms	Criterion A
		70% of 200Vac	500ms	Criterion A
		50% of 200Vac	200ms	Criterion A
Powerful transients	VDE 0160	Over entire load range	750V, 1.3ms	Criterion A

Criteria:

- A:** Power supply shows normal operation behavior within the defined limits.
- C:** Temporary loss of function is possible. Power supply may shut-down and restarts by itself. No damage or hazards for the power supply will occur.

EMC Emission		According generic standards: EN 61000-6-3 and EN 61000-6-4	
Conducted emission	EN 55011, EN 55022, FCC Part 15, CISPR 11, CISPR 22	EN 55022	Class B, input lines Class B, output lines
Radiated emission	EN 55011, EN 55022		Class B
Harmonic input current	EN 61000-3-2		fulfilled
Voltage fluctuations, flicker	EN 61000-3-3		fulfilled *)

This device complies with FCC Part 15 rules.

Operation is subjected to following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

*) tested with constant current loads, non pulsing

Switching Frequencies		The power supply has three converters with four different switching frequencies included. One is nearly constant. The other two are input voltage and load dependent.	
Switching frequency 1	110kHz	nearly constant	
Switching frequency 2	35kHz 150kHz	input voltage and load dependent	
Switching frequency 3	10kHz to 300kHz	output voltage and load dependent	
Switching frequency 4	28kHz to 40kHz	input voltage and load dependent	

16. ENVIRONMENT

Operational temperature *)	-25°C to +70°C (-13°F to 158°F)	reduce output power according Fig. 16-1
Storage temperature	-40 to +85°C (-40°F to 185°F)	for storage and transportation
Output de-rating	24W/°C	60-70°C (140°F to 158°F)
Humidity **)	5 to 95% r.H.	IEC 60068-2-30
Vibration sinusoidal	2-17.8Hz: ±1.6mm; 17.8-500Hz: 1g 2 hours / axis	IEC 60068-2-6
Shock	15g 6ms, 10g 11ms 3 bumps / direction, 18 bumps in total	IEC 60068-2-27
Altitude	0 to 2000m (0 to 6 560ft) 2000 to 6000m (6 560 to 20 000ft)	without any restrictions reduce output power or ambient temperature, see Fig. 16-2 IEC 62103, EN 50178, overvoltage category II
Altitude de-rating	60W/1000m or 5°C/1000m	> 2000m (6500ft), see Fig. 16-2
Over-voltage category	III II	IEC 62103, EN 50178, altitudes up to 2000m altitudes from 2000m to 6000m
Degree of pollution	2	IEC 62103, EN 50178, not conductive

*) Operational temperature is the same as the ambient temperature and is defined as the air temperature 2cm below the unit.
 **) Do not energize while condensation is present

Fig. 16-1 Output current vs. ambient temp.

Fig. 16-2 Output current vs. altitude

17. PROTECTION FEATURES

Output protection	Electronically protected against overload, no-load and short-circuits *)	
Output over-voltage protection	typ. 58.5Vdc max. 60Vdc	In case of an internal power supply defect, a redundant circuit limits the maximum output voltage. The output shuts down and automatically attempts to restart.
Degree of protection	IP 20	EN/IEC 60529
Penetration protection	> 5mm	e.g. screws, small parts
Over-temperature protection	yes	Output shut-down with automatic restart
Input transient protection	MOV (Metal Oxide Varistor)	
Internal input fuse	T12.5A H.B.C.	not user replaceable

*) In case of a protection event, audible noise may occur.

18. SAFETY FEATURES

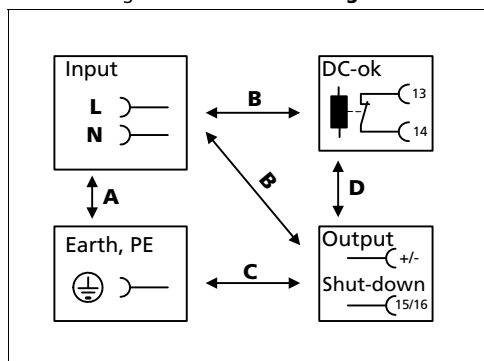

Input / output separation *)	SELV PELV	IEC/EN 60950-1 IEC/EN 60204-1, EN 50178, IEC 62103, IEC 60364-4-41
Class of protection	I	PE (Protective Earth) connection required
Isolation resistance	> 5MΩ	Input to output, 500Vdc
PE resistance	< 0.1Ω	
Touch current (leakage current)	typ. 0.59mA < 0.75mA typ. 1.38mA < 1.74mA	230Vac, 50Hz, TN mains 264Vac, 50Hz, TN mains 230Vac, 50Hz, IT mains 264Vac, 50Hz, IT mains

*) Double or reinforced insulation

19. DIELECTRIC STRENGTH

The output voltage is floating and has no ohmic connection to the ground. Type and factory tests are conducted by the manufacturer. Field tests may be conducted in the field using the appropriate test equipment which applies the voltage with a slow ramp (2s up and 2s down). Connect all input terminals together as well as all output poles before conducting the test. When testing, set the cut-off current settings to the value in the table below.

Fig. 19-1 Dielectric strength

		A	B	C	D
Type test	60s	2500Vac	3000Vac	500Vac	500Vac
Factory test	5s	2500Vac	2500Vac	500Vac	500Vac
Field test	5s	2000Vac	2000Vac	500Vac	500Vac
Cut-off current setting		> 20mA	> 20mA	> 50mA	> 1mA

To fulfil the PELV requirements according to EN60204-1 § 6.4.1, we recommend that either the + pole, the - pole or any other part of the output circuit shall be connected to the protective earth system. This helps to avoid situations in which a load starts unexpectedly or can not be switched off when unnoticed earth faults occur.

20. APPROVALS

EC Declaration of Conformity		The CE mark indicates conformance with EMC directive 2004/108/EC and the low-voltage directive (LVD) 2006/95/EC.
IEC 60950-1 2 nd Edition		CB Scheme, Information Technology Equipment
UL 508		Listed for use as Industrial Control Equipment; U.S.A. (UL 508) and Canada (C22.2 No. 107-1-01); E-File: E198865
UL 60950-1 2 nd Edition		Recognized for use as Information Technology Equipment, Level 5; U.S.A. (UL 60950-1) and Canada (C22.2 No. 60950); E-File: E137006
ANSI / ISA 12.12.01-2007 (Class I Div 2), pending		Recognized for use in Hazardous Location Class I Div 2 T? Groups A,B,C,D systems; U.S.A. (ANSI / ISA 12.12.01-2007) and Canada (C22.2 No. 213-M1987) The unit is suitable for use in Class I Division 2 Groups A, B, C, D locations. Substitution of components may impair suitability for Class I Division 2 environment. Do not disconnect equipment unless power has been switched off. Wiring must be in accordance with Class I, Division 2 wiring methods of the National Electrical Code, NFPA 70, and in accordance with other local or national codes.
Marine, pending		GL (Germanischer Lloyd) classified and ABS (American Bureau for Shipping) PDA Environmental category: C, EMC2 Marine and offshore applications
GOST P pending		Certificate of Conformity for Russia and other GUS countries

21. FULFILLED STANDARDS

EN 61558-2-17	Safety of Power Transformers
EN/IEC 60204-1	Safety of Electrical Equipment of Machines
EN/IEC 61131-2	Programmable Controllers
EN 50178, IEC 62103	Electronic Equipment in Power Installations

22. USED SUBSTANCES

The unit does not release any silicone and is suitable for use in paint shops.

The unit conforms to the RoHS directive 2002/96/EC

Electrolytic capacitors included in this unit do not use electrolytes such as Quaternary Ammonium Salt Systems.

Plastic housings and other molded plastic materials are free of halogens, wires and cables are not PVC insulated.

The production material within our production does not include following toxic chemicals:

Polychlorized Biphenyl (PCB), Polychlorized Terphenyl (PCT), Pentachlorophenol (PCP), Polychlorinated naphthalene (PCN), Polybrom Biphenyl (PBB), Polybrom Biphenyl-oxyd (PBO), Polybrominated Diphenylether (PBDE), Polychlorinated Diphenylether (PCDE), Polydibromophenyl Oxyd (PBDO), Cadmium, Asbestos, Mercury, Silica

23. PHYSICAL DIMENSIONS AND WEIGHT

Weight 1800g / 3.97lb

DIN-Rail Use 35mm DIN-rails according to EN 60715 or EN 50022 with a height of 7.5 or 15mm.
The DIN-rail height must be added to the unit depth (127mm) to calculate the total required installation depth.

Installation Clearances See chapter 2

Fig. 23-1 Front view

Fig. 23-2 Side view

24. ACCESSORIES

ZM2.WALL Wall mounting bracket

This bracket is used to mount specific DIMENSION units onto a flat surface without utilizing a DIN-Rail.

*) Picture of the power supply is for representation only

Buffer module UF20.481

This buffer unit is a supplementary device for DC 48V power supplies. It delivers power to bridge typical mains failures or extends the hold-up time after turn-off of the AC power. In times when the power supply provides sufficient voltages, the buffer unit stores energy in integrated electrolytic capacitors. In case of mains voltage fault, this energy is released again in a regulated process. One buffer module can deliver 20A.

The buffer unit does not require any control wiring. It can be added in parallel to the load circuit at any given point. Buffer units can be added in parallel to increase the output ampacity or the hold-up time.

Redundancy module YR2.DIODE

The YR2.DIODE is a dual redundancy module, which has two diodes with a common cathode included. Each YR2.DIODE module can be used up to 20A nominal output current. Therefore, one redundancy module is required for each power supply. The redundancy module can be used

for various purposes. The most popular application is to configure highly reliable and true redundant power supply systems. Another interesting application is the separation of sensitive loads from non-sensitive loads. This avoids the distortion of the power quality for the sensitive loads which can cause controller failures.

25. APPLICATION NOTES

25.1. REPETITIVE PULSE LOADING

Typically, a load current is not constant and varies over time. This power supply is designed to support loads with a higher short-term power demand (=BonusPower®). The short-term duration is hardware controlled by an output power manager and is available on a repeated basis. If the BonusPower® load lasts longer than the hardware controller allows it, the output voltage will dip and the next BonusPower® is available after the BonusPower® recovery time (see chapter 6) has elapsed.

To avoid this, the following rules must be met:

- The power demand of the pulse must be below 150% of the nominal output power.
- The duration of the pulse power must be shorter than the allowed BonusPower® time. (see output section)
- The average (R.M.S.) output current must be below the specified continuous output current.
If the R.M.S. current is higher, the unit will respond with a thermal shut-down after a period of time. Use the maximum duty cycle curve (Fig. 25-2) to check if the average output current is below the nominal current.
- The duty cycle must be below 0.75.

Fig. 25-1 Repetitive pulse loads, definitions

- P₀ Base load (W)
- P_{PEAK} Pulse load (above 100%)
- T₀ Duration between pulses (s)
- T_{PEAK} Pulse duration (s)

Fig. 25-2 Max. duty cycle curve

$$\text{DutyCycle} = \frac{T_{\text{peak}}}{T_{\text{peak}} + T_0}$$

$$T_0 = \frac{T_{\text{peak}} - (\text{DutyCycle} \times T_{\text{peak}})}{\text{DutyCycle}}$$

Example: A load is powered continuously with 480W (= 50% of the rated output load). From time to time a peak power of 1440W (= 150% of the rated output load) is needed for 1 second.

The question is: How often can this pulse be supplied without overloading the power supply?

- Make a vertical line at P_{PEAK} = 150% and a horizontal line where the vertical line crosses the P₀ = 50% curve. Read the max. duty cycle from the duty cycle-axis (= 0.37)
- Calculate the required pause (base load) length T₀:
- Result: The required pause length = 1.7s
- Max. repetition rate = pulse +pause length = **2.7s**

$$T_0 = \frac{T_{\text{peak}} - (\text{DutyCycle} \times T_{\text{peak}})}{\text{DutyCycle}} = \frac{1\text{s} - (0.37 \times 1\text{s})}{0.37} = \mathbf{1.7\text{s}}$$

More examples for pulse load compatibility:

P _{PEAK}	P ₀	T _{PEAK}	T ₀	P _{PEAK}	P ₀	T _{PEAK}	T ₀
1440W	960W	1s	>25s	1440W	480W	0.1s	>0.16s
1440W	0W	1s	>1.3s	1440W	480W	1s	>1.6s
1200W	480W	1s	> 0.75s	1440W	480W	3s	>4.9s

25.2. PEAK CURRENT CAPABILITY

Solenoids, contactors and pneumatic modules often have a steady state coil and a pick-up coil. The inrush current demand of the pick-up coil is several times higher than the steady-state current and usually exceeds the nominal output current (including the PowerBoost). The same situation applies when starting a capacitive load.

Branch circuits are often protected with circuit breakers or fuses. In case of a short or an overload in the branch circuit, the fuse needs a certain amount of over-current to trip or to blow. The peak current capability ensures the safe operation of subsequent circuit breakers.

Assuming the input voltage is turned on before such an event, the built-in large sized output capacitors inside the power supply can deliver extra current. Discharging this capacitor causes a voltage dip on the output. The following two examples show typical voltage dips:

Fig. 25-3 Peak load with 2x the nominal current for 50ms, typ.

Peak load 40A (resistive) for 50ms
Output voltage dips from 48V to 41V.

Fig. 25-4 Peak load with 5x the nominal current for 5ms, typ.

Peak load 100A (resistive) for 5ms
Output voltage dips from 48V to 33V.

25.3. BACK-FEEDING LOADS

Loads such as decelerating motors and inductors can feed voltage back to the power supply. This feature is also called return voltage immunity or resistance against Back- E.M.F. (Electro Magnetic Force).

This power supply is resistant and does not show malfunctioning when a load feeds back voltage to the power supply. It does not matter whether the power supply is on or off.

The maximum allowed feed-back-voltage is 63Vdc. The absorbing energy can be calculated according to the built-in large sized output capacitor which is specified in chapter 6.

25.4. EXTERNAL INPUT PROTECTION

The unit is tested and approved for branch circuits up to 30A (U.S.A.) and 32A (IEC). An external protection is only required if the supplying branch has an ampacity greater than this. Check also local codes and local requirements. In some countries local regulations might apply.

If an external fuse is necessary or utilized, minimum requirements need to be considered to avoid nuisance tripping of the circuit breaker. A minimum value of 10A B- or 8A C-Characteristic breaker should be used

25.5. CHARGING OF BATTERIES

The power supply can be used to charge lead-acid or maintenance free batteries. (Four 12V batteries in series)

Instructions for charging batteries:

- a) Set jumper on the front of the unit into "Parallel Use"
- b) Set output voltage (measured at no load and at the battery end of the cable) very precisely to the end-of-charge voltage.

End-of-charge voltage	55.6V	55.0V	54.3V	53.6V
Battery temperature	10°C	20°C	30°C	40°C

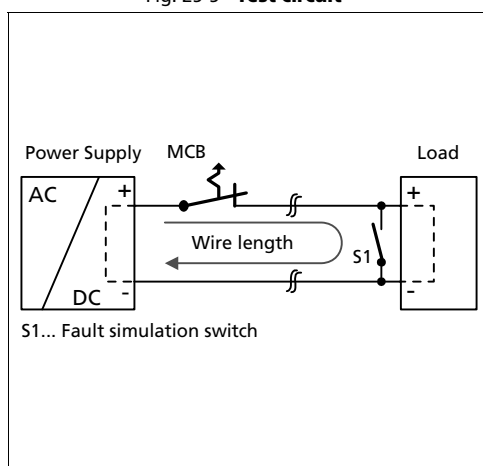

- c) Use a 25A circuit breaker (or blocking diode) between the power supply and the battery.
- d) Ensure that the output current of the power supply is below the allowed charging current of the battery.
- e) Use only matched batteries when putting 12V types in series.
- f) The return current to the power supply (battery discharge current) is typ. 21mA when the power supply is switched off (except in case a blocking diode is utilized).

25.6. OUTPUT CIRCUIT BREAKERS

Standard miniature circuit breakers (MCB's or UL1077 circuit breakers) are without doubt, one of the most efficient and economical ways to open circuits on faulty branches. Most of these breakers may also be used on 48V branches. MCB's are designed to protect wires and circuits. If the ampere value and the characteristics of the MCB are adapted to the wire size that is used, the wiring is considered as thermally safe regardless of whether the MCB opens or not.

To avoid voltage dips and under-voltage situations in adjacent 48V branches which are supplied by the same source, a fast (magnetic) tripping of the MCB is desired. A quick shutdown within 10ms is necessary corresponding roughly to the ride-through time of PLC's. This requires power supplies with high current reserves and large output capacitors. Furthermore, the impedance of the faulty branch must be sufficiently small in order for the current to actually flow. The best current reserve in the power supply does not help if Ohm's law does not permit current flow. The following table has typical test results showing which B- and C-Characteristic MCBs magnetically trip depending on the wire cross section and wire length.

Fig. 25-5 Test circuit

Maximal wire length*) for a magnetic (fast) tripping:

	0.75mm ²	1.0mm ²	1.5mm ²	2.5mm ²
C-2A	74m	89m	146m	190m
C-3A	57m	79m	128m	163m
C-4A	43m	52m	73m	116m
C-6A	19m	25m	27m	57m
C-8A	8m	12m	17m	25m
C-10A	6m	9m	13m	19m
C-13A	3m	5m	7m	10m
B-6A	38m	52m	76m	113m
B-10A	18m	26m	38m	55m
B-13A	12m	19m	29m	42m
B-16A	6m	8m	12m	20m
B-20A	1m	2m	4m	5m

*) Don't forget to consider twice the distance to the load (or cable length) when calculating the total wire length (+ and - wire).

25.7. PARALLEL USE TO INCREASE OUTPUT POWER

Power supplies from the same series (Q-Series) can be paralleled to increase the output power. Parallel use is only allowed in the standard mounting orientation (input and output terminals on bottom of the unit). The output voltage shall be adjusted to the same value ($\pm 100\text{mV}$) in "Single use" mode at with the same load conditions on all units, or the units can be left with the factory settings. After the adjustments, the jumper on the front of the unit shall be moved from "Single use" to "Parallel use" mode in order to achieve load sharing. The "Parallel use" mode regulates the output voltage in such a manner that the voltage at no load is approx. 5% higher than at nominal load. If no jumper is plugged in, the unit is in "Single use" mode. Factory setting is also "Single use" mode. A fuse (or diode) on the output of each unit is only required if more than three units are connected in parallel. Keep an installation clearance of 15mm (left / right) between two power supplies and avoid installing the power supplies on top of each other. Do not use power supplies in parallel in mounting orientations other than the standard mounting orientation (input- and output terminals on the bottom of the unit) or in any other condition where a derating of the output current is required (e.g. altitude, above 60°C, ...). Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies.

25.8. PARALLEL USE FOR REDUNDANCY

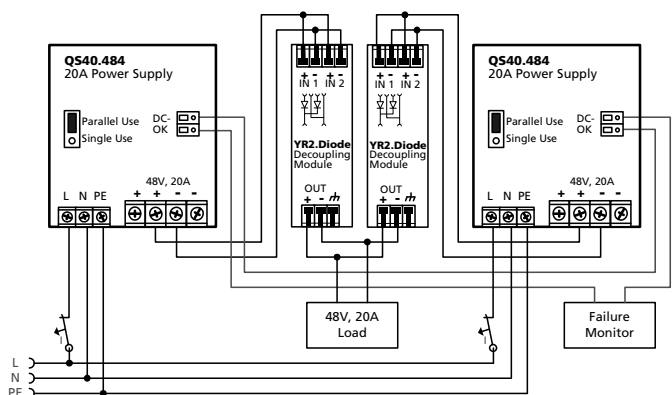

Power supplies can be paralleled for redundancy to gain higher system availability. Redundant systems require a certain amount of extra power to support the load in case one power supply unit fails. The simplest way is to put two power supplies in parallel. This is called a 1+1 redundancy. In case one power supply unit fails, the other one is automatically able to support the load current without any interruption. Redundant systems for a higher power demand are usually built in a N+1 method. E.g. five power supplies, each rated for 20A are paralleled to build a 80A redundant system. For N+1 redundancy the same restrictions apply as for increasing the output power, see also section 25.7.

Please note: This simple way to build a redundant

system does not cover failures such as an internal short circuit in the secondary side of the power supply. In such a case, the defective unit becomes a load for the other power supplies and the output voltage can not be maintained any more. This can be avoided by utilizing decoupling diodes which are included in the redundancy module YR2.DIODE.

Recommendations for building redundant power systems:

- Use separate input fuses for each power supply.
- Set the power supply into "Parallel Use" mode.
- Monitor the individual power supply units. Therefore, use the DC-OK relay contact of the QS40 power supply.
- It is desirable to set the output voltages of all units to the same value ($\pm 100\text{mV}$) or leave it at the factory setting.

25.9. DAISY CHAINING OF OUTPUTS

Daisy chaining (jumping from one power supply output to the next) is allowed as long as the average output current through one terminal pin does not exceed 54A. If the current is higher, use a separate distribution terminal block.

Fig. 25-6 Daisy chaining of outputs

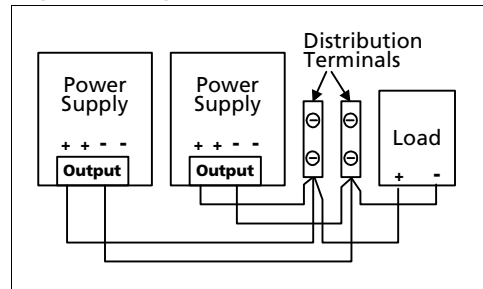

Fig. 25-7 Using distribution terminals

25.10. SERIES OPERATION

Power supplies of the same type can be connected in series for higher output voltages. It is possible to connect as many units in series as needed, providing the sum of the output voltage does not exceed 150Vdc. Voltages with a potential above 60Vdc are not SELV any more and can be dangerous. Such voltages must be installed with a protection against touching. Earthing of the output is required when the sum of the output voltage is above 60Vdc. Avoid return voltage (e.g. from a decelerating motor or battery) which is applied to the output terminals. Keep an installation clearance of 15mm (left / right) between two power supplies and avoid installing the power supplies on top of each other. Do not use power supplies in series in mounting orientations other than the standard mounting orientation (input- and output terminals on the bottom of the unit). Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies.

25.11. INDUCTIVE AND CAPACITIVE LOADS

The unit is designed to supply any kind of loads, including unlimited inductive loads and capacitive loads up to 0.5F.

25.12. OPERATION ON TWO PHASES

The power supply can also be used on two-phases of a three-phase-system. Such a phase-to-phase connection is allowed as long as the supplying voltage is below 240V+10%. Use a fuse or a circuit breaker to protect the N input. The N input is internally not protected and is in this case connected to a hot wire. Appropriate fuses or circuit breakers are specified in section 25.4 "External Input Protection".

25.13. USE IN A TIGHTLY SEALED ENCLOSURE

When the power supply is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than outside. In such situations, the inside temperature defines the ambient temperature for the power supply.

The following measurement results can be used as a reference to estimate the temperature rise inside the enclosure.

The power supply is placed in the middle of the box, no other heat producing items are inside the box

Enclosure:	Rittal Typ IP66 Box PK 9522 100, plastic, 250x180x165mm
Load:	48V, 16A; (=80%) load is placed outside the box
Input:	230Vac
Temperature inside enclosure:	60.1°C (in the middle of the right side of the power supply with a distance of 2cm)
Temperature outside enclosure:	23.1°C
Temperature rise:	37K

25.14. MOUNTING ORIENTATIONS

Mounting orientations other than input- and output terminals on the bottom require a reduction in continuous output power or a limitation in the maximum allowed ambient temperature. The amount of reduction influences the lifetime expectancy of the power supply. Therefore, two different derating curves for continuous operation can be found below:

Curve A1 Recommended output current.

Curve A2 Max allowed output current (results in approximately half the lifetime expectancy of A1).
